

14 - Database Schema & Data Architecture

Triads Future

Database Design & Content Model

Version: 1.0

Status: Locked

Purpose

This document defines the database architecture for the Triads Future website.

It specifies every entity, its fields, relationships, validation rules and future expansion strategy.

The objective is to create a scalable, maintainable and normalized database structure that supports both the public website and the Content Management System (CMS).

This document should be completed before writing the Prisma schema or implementing backend APIs.

Database Philosophy

The database should be:

- Normalized
- Scalable
- Secure
- Maintainable
- Future-ready

Every table should represent a single business entity.

Avoid duplicate information.

The database should remain the single source of truth.

Database Overview

Version 1 contains the following entities:

- Admin
- Appointments
- Projects
- Blog Posts
- Testimonials
- FAQs
- Media
- Website Settings

Future versions may introduce:

- Categories
- Tags
- Users
- Roles
- Analytics
- CRM
- Notifications

Entity Relationship Overview

Admin manages:

- Projects
- Blog Posts
- Testimonials
- FAQs
- Website Settings

Projects and Blog Posts can reference Media.

Appointments remain independent.

Entity: Admin

Purpose

Manage website content and system settings.

Store global website configuration.

Fields

- Company Name
- Logo
- Favicon
- Phone
- Email
- Address
- Business Hours
- Facebook
- Instagram
- LinkedIn
- Footer Text
- Updated At

Only one settings record should exist.

Slug Strategy

Public URLs should always use SEO-friendly slugs.

Examples:

- /work/luxury-builder-branding
- /insights/business-growth-strategy

Slug Rules:

- Lowercase
 - Hyphen separated
 - Unique
-

Validation Standards

Every entity should validate:

- Required fields
- Duplicate records
- Duplicate slugs
- Upload type
- Upload size

Validation should occur on both client and server.

Future Expansion

The schema should allow future support for:

- CRM
 - Analytics
 - User Accounts
 - Roles
 - Permissions
 - Notifications
 - Activity Logs
 - Proposal Builder
 - Email Campaigns
-

Security Standards

Sensitive information includes:

- Passwords
- Internal Notes

Passwords must always be hashed.

Internal notes must never be exposed through public APIs.

Database Design Principles

Always:

- Normalize data.
 - Avoid duplication.
 - Use relationships where appropriate.
 - Design for scalability.
 - Keep entities focused on one responsibility.
-

Final Principle

The database is the foundation of the application.

A well-designed schema simplifies development, reduces bugs, improves performance and makes future expansion significantly easier.

Every API, CMS module and public page depends on the quality of this database architecture.
