

13 - Development Blueprint

Triads Future

Development Architecture & Implementation Plan

Version: 1.0

Status: Locked

Purpose

This document defines the development strategy, implementation order, project architecture, coding standards and deployment plan for Version 1 of the Triads Future website.

The objective is to minimize development risk, avoid scope creep and ensure a stable production-ready release.

Development Philosophy

Version 1 is built with one objective:

Deliver a polished, maintainable and scalable product.

Development should prioritize:

- Stability over complexity.
- Reusability over duplication.
- Performance over unnecessary features.
- Completion over perfection.

Every feature added should have a clear business purpose.

Technology Stack

Frontend

- Next.js (App Router)
- TypeScript
- Tailwind CSS
- Framer Motion (minimal usage)

Backend

- Next.js Route Handlers
- Server Actions (where appropriate)

Database

Preferred:

- PostgreSQL

Alternative:

- Supabase PostgreSQL

Development:

- Local PostgreSQL

ORM

- Prisma ORM

Reasons:

- Type Safety
- Developer Experience
- Easy Migration
- Scalable Schema

Authentication

Version 1:

- Single Administrator
- Session-based authentication

Future:

- Role-based access

Storage

Development:

- Local uploads

Production:

- Cloud storage (Cloudinary or Supabase Storage)

Feature-Based Architecture

Each feature owns:

- Components
- Hooks
- Validation
- Types
- Services

Development Order

Phase 1: Project Setup

- Create project
- Configure TypeScript
- Install Tailwind
- Configure ESLint
- Configure Prettier
- Configure Prisma
- Configure Database

Phase 2: Foundation

- Global Layout
- Fonts
- Theme
- Navigation
- Footer
- Responsive Grid
- Shared Components

Phase 3: Homepage

Phase 4: Public Pages

- Solutions

- Work
- About
- Insights
- Contact

Phase 5: CMS

- Dashboard
- Appointments
- Work
- Insights
- Testimonials
- FAQ
- Media
- Settings
- Profile

Phase 6: Database Integration

- Projects
- Articles
- Testimonials
- Appointments
- FAQ
- Settings

Phase 7: SEO

- Metadata
- Open Graph
- Structured Data
- Sitemap
- Robots
- Canonical URLs

Phase 8: Animations

Phase 9: Testing

- Desktop
- Tablet
- Mobile
- CMS
- Forms
- SEO
- Accessibility
- Performance

Phase 10: Deployment

- Production Build
- Final Testing
- Launch

Coding Standards

- One responsibility per file.
- Separate UI, Logic, Database, Validation and Utilities.

Component Rules

- Reusable
- Typed
- Documented
- Accessible
- Responsive

State Management

- Prefer local state.
- Use Context only when necessary.

Validation

- Validate forms, API requests, uploads and database input.

Performance

- Server Components
- Image optimization
- Lazy loading
- Dynamic imports
- Code splitting

SEO Checklist

- Title
- Description
- Open Graph
- Twitter Card
- Canonical URL
- Semantic HTML

Accessibility

- Keyboard navigation
- Alt text
- Focus states
- ARIA labels

Security

- Protected CMS routes
- Password hashing
- Environment variables
- Input validation

Testing

- Navigation
- Forms
- CMS
- Responsive layouts

- SEO
- Accessibility
- Performance

Deployment

- Environment variables
- Database
- Storage
- HTTPS
- Sitemap
- robots.txt
- 404 and 500 pages

Version Control

main

feature branches

Scope Control

New ideas belong in ideas.md.

Definition of Done

- Functional
- Responsive
- Accessible
- SEO Ready
- Error Handled
- Tested
- Reviewed

Final Development Principle

Build the product that was planned, not the product imagined halfway through development.
Consistency, quality and completion are more valuable than adding one more feature before launch.
